

The banner features a background of flowing blue and grey waves. On the left, there are two circular inset images: the top one shows a person in a white lab coat and mask working with equipment, and the bottom one shows a laboratory setting with blue lighting. The PDA logo is in the top right corner. The main text is centered and reads: 'Welcome 2010 Pharmaceutical Freeze Drying Workshop' in a large, bold font, followed by the subtitle 'Current Science and Technology of Lyophilization' in a smaller, italicized font. Below this, the dates and location are listed: 'NOVEMBER 15-18, 2010 SHERATON SAN DIEGO HOTEL & MARINA SAN DIEGO, CALIFORNIA'. At the bottom, a line of text specifies the schedule: 'PRE-WORKSHOP COURSE NOVEMBER 15-16 WORKSHOP NOVEMBER 17-18 EXHIBITION NOVEMBER 17-18'.

Welcome
2010 Pharmaceutical Freeze Drying Workshop
Current Science and Technology of Lyophilization

NOVEMBER 15-18, 2010
SHERATON SAN DIEGO HOTEL & MARINA
SAN DIEGO, CALIFORNIA

PRE-WORKSHOP COURSE NOVEMBER 15-16 WORKSHOP NOVEMBER 17-18 EXHIBITION NOVEMBER 17-18

First Approach Applying QbD in a Scale-Up of a Lyophilization Cycle for an Antiviral Product

Quality by Design in Lyophilization

Connecting People, Science and Regulation

The sequence of QbD:

Quality Target Product Profile (QTPP)

Critical Process Parameters (CPP) (Inputs)

Risk Assessment linking CPP & CQA (RA)

Design Space (DS)

Critical Material Attributes (CMA)

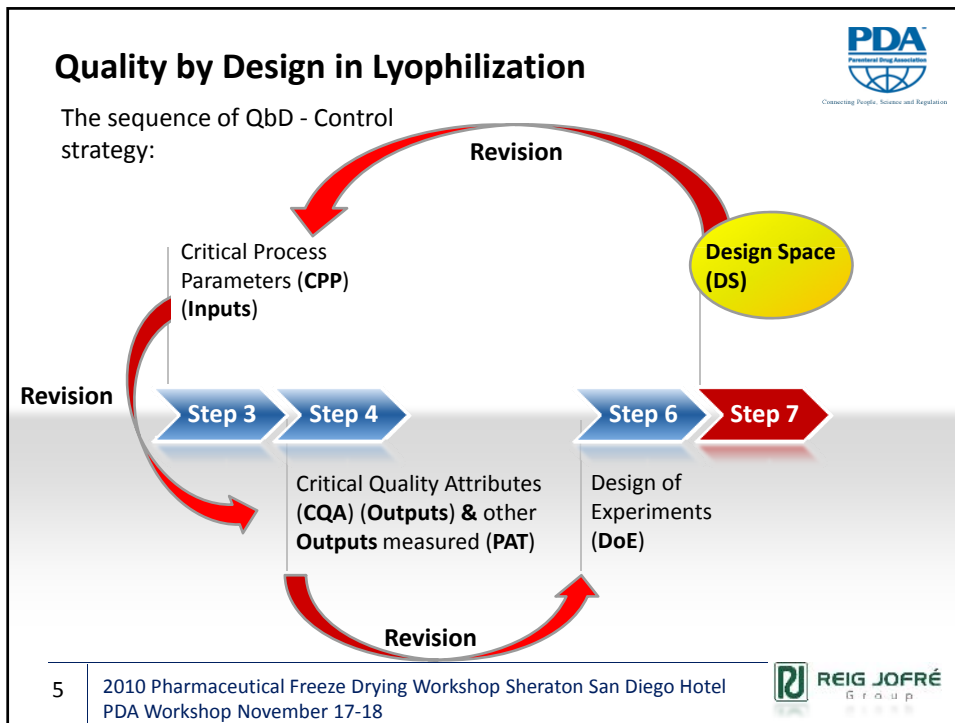

Critical Quality Attributes (CQA) (Outputs)

Design of Experiments (DoE)

4

2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

Quality Target Product Profile (QTPP)

- The **TPP** is a summary of drug labeling concepts. The **QTPP** is its natural extension for product quality.
- Each element of the **QTPP** is related with one of the **CQA** for the product.
- The **CQA** selected for the product (an antiviral) are related to the freeze drying process:

QTPP Element	Target (CQA)
Appearance	Right
Residual Moisture Content (RMC)	< 6 %
Reconstitution Time	< 2 min

- **Critical Quality Attributes:** A physical, chemical, biological or microbiological property or characteristic that should be within an appropriate limit, range, or distribution to ensure the desired product quality.

PDA Workshop November 17-18

Critical Material Attributes (CMA)

Connecting People, Science and Regulation

A key parameter or attribute may eventually be designated as “critical” depending on severity and probability of failure and its ability to be detected. Nosal R and T. Schultz, PQLI Definition of Criticality. *J. Pharm. Innov.* 3:pp 69-78, 2008

Key Attribute	Analytical Source	Rank
(1) Temperature of Total Solidification (T_{ts})	DSC/FDM	< -26 °C
(2) Glass Transition Temperature (T_g')	DSC	[-72:-32] °C
(3) Collapse Temperature (T_{co})	FDM	[-58:-56] °C
(4) Melting Temperature (T_m)	DSC/FDM	[-20:-13] °C
(5) Height of the Solution (inside the vial)	Measure	10 mm
(6) Solid Material Content	Defined (TPP)	10.5 %
(7) Max. Exposure Temp. Allowed (T_{max})	Stability Studies	<35°C
(8) Volume (to ensure the API dose)	Defined (TPP)	2.8 0.1 ml

7 2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

Critical Process Parameters (CPP)

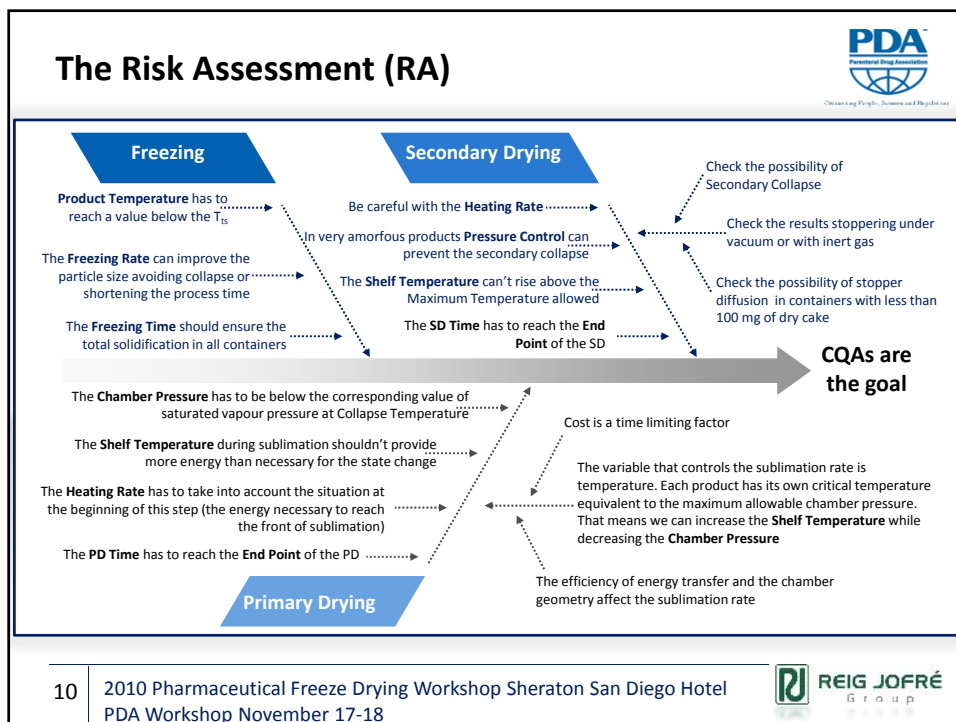

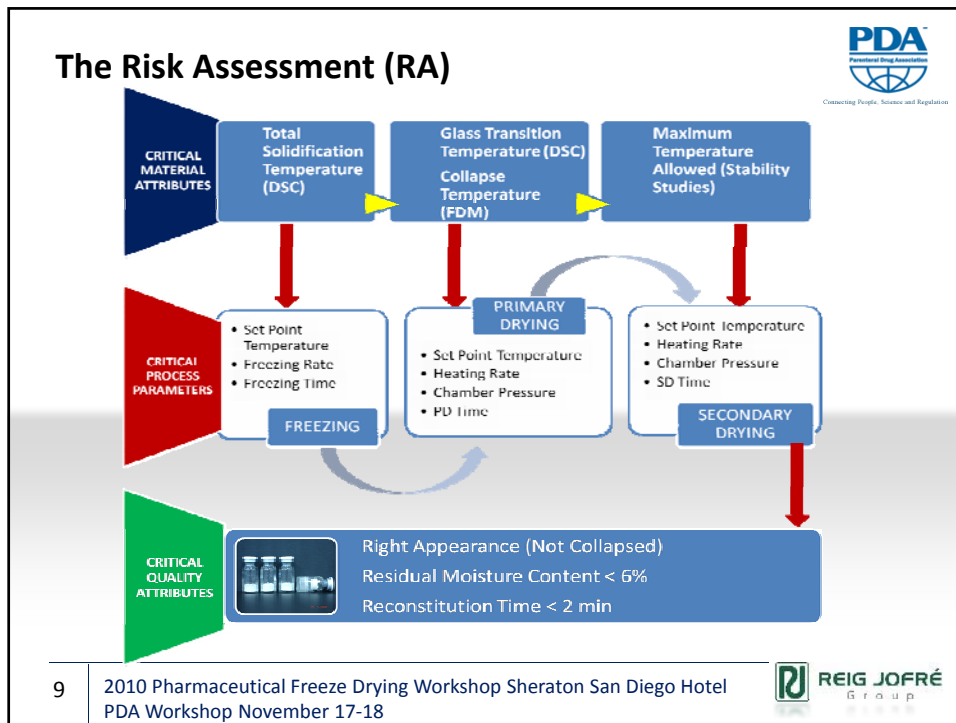

Connecting People, Science and Regulation

Critical Process Parameter	Related Variable	Process Step
Set Point Shelf Temperature	T	FREEZING
Freezing Rate	Fr	
Freezing Time	Ft	
Set Point Shelf Temperature	T	PRIMARY DRYING
Heating Rate	HRa	
Chamber Pressure	P	
Primary Drying Time	PDt	SECONDARY DRYING
Set Point Shelf Temperature	T	
Heating Rate	HRa	
Chamber Pressure	P	
Secondary Drying Time	SDt

PDA Workshop November 17-18

The Case Study (QTPP)

Connecting People, Science and Regulation

- **Appearance:** Right. Structural collapse leads to a variety of changes in cake properties of both esthetical and stability concerns. That means the changes in cake morphology and inner structure were clearly influenced by the different drying conditions and may impact degradation reactions and storage stability of the product.

- **Residual Moisture Content (RMC):** The specification is under 6 % in most of the Aciclovir formulations. Some dossiers describe the specification as under 4 %. The experience indicates that obtaining a value from 2 up to 3 %, at time zero, doesn't produce stability problems at the expiry date, currently 3 years.
- **Reconstitution Time:** < 2 min. It is also possible to reach values less than 1 min.

11 2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

The Case Study (CMA)

Connecting People, Science and Regulation

(1) Temperature of total solidification (T_{ts}) < -26 °C

12 2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

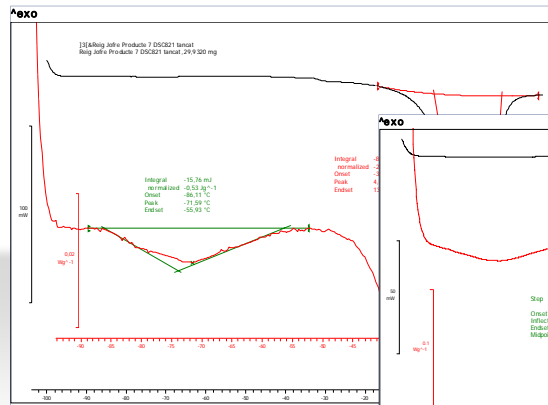

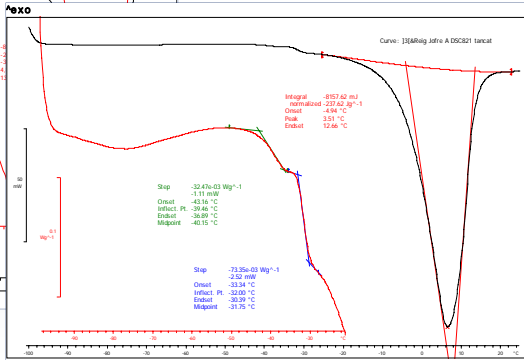

Connecting People, Science and Regulation

The Case Study (CMA)

(2) Glass Transition Temperature (T_g') : [-72:-32] °C

Lab: IQAC

Three Glass Transition Observed

13

2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

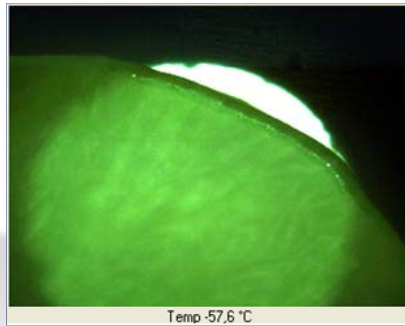

Connecting People, Science and Regulation

The Case Study (CMA)

(3) CollapseTemperature (T_{co}) : [-58:-56] °C

Temp -57.6 °C

(7) Maximum Temperature (T_{max}) Allowed by the product: The stability studies, regarding the impurities generated, marked the value of 35 °C as maximum temperature the product can withstand.

14

2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

The Case Study (RA Conclusions)

Connecting People, Science and Regulation

1. The attempts to avoid the collapse by means of annealing turned out not useful.
 - The range of T_g' & T_{co} is too low for the equipment capabilities. Little or nothing can be done during the freezing step.
2. A certain time interval will be needed until the energy supplied by the shelves reaches the sublimation front of the frozen product.

Without Annealing

Shelf Temperature

15 2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

The Case Study (RA Conclusions)

Connecting People, Science and Regulation

3. During the Primary Drying (PD) the sublimation front temperature is controlled by the chamber pressure.
 - Considering this value as the Critical Temperature (CT), several strategies can be carried out to establish the initial DoE.
 - Anyway, the sublimation rate is controlled by the shelf temperature. The initial DoE will analyze the variations of two factors at a time: P & T; taking five different CTs for the product, from the more aggressive criteria (Cycle 1) to the more conservative (Cycle 5).
 - The time (t) only justifies the reach of the end point.
 - In order to guarantee the process outcomes, the chamber pressure will be set at 50 % of the one corresponding to the CT.
4. The Secondary Drying doesn't show any collapse problems.

16 2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

The Case Study (Initial DoE)

Connecting People, Science and Regulation

Five different CT's for the product, from the more aggressive criteria (Cycle 1) to the more conservative (Cycle 5):

Process Parameter	Cycle 1	Cycle 2	Cycle 3	Cycle 4	Cycle 5
Critical Temperature (CT) [°C]	-25	-30	-35	-40	-45
Corresponding Pressure -Pirani- [mbar]	9.7×10^{-1}	5.8×10^{-1}	3.4×10^{-1}	2.0×10^{-1}	1.1×10^{-1}
Set Points in the equipment					
Shelf Temperature [°C]	-5	-10	-15	-20	-25
PD Time [hours]	18	22	26	30	34
Chamber Pressure (Pirani) [mbar]	4.8×10^{-1}	2.9×10^{-1}	1.7×10^{-1}	1.1×10^{-1}	4.5×10^{-2}
Total Process Time [hours]	34	38	42	46	50

The chamber pressure will be set at 50 % of the one corresponding to the CT.

The Design Space (DS)

Pharmaceutical Drug Association
Connecting People, Science and Regulation

■ Is our DoE the best for the purpose?

First DoE Approach

Design Space

- It will check the contribution of the CPP selected

Second DoE

- Allows us adjust the limits for the CPP
- A new DS will be created from the new DoE

22 2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

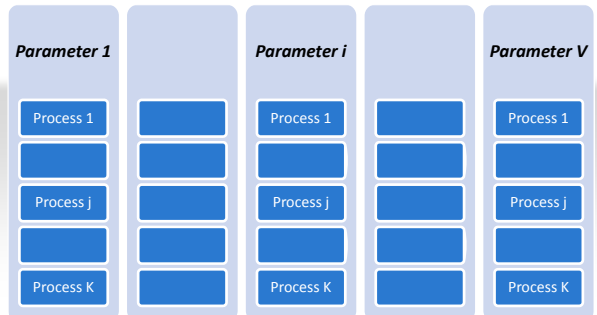

Connecting People, Science and Regulation

The Design Space (DS)

- How are we going to build the DS?

- Confection of one unfolding matrix:
 - **Variables (columns):** Available process parameters (18).
 - **Objets (rows):** Grouping each process in vertical (different lenght for each process).

23
2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

Connecting People, Science and Regulation

The Design Space (DS)

DATA TREATMENT (How manage the scale and the noise)

- We have obtained a matrix of 18 columns and 33,128 rows.
- **AUTOSCALING:** It is necessary to give the same weight for all the data when comparing the different variables:

$$f(x) = \frac{x_{i,A} - \bar{x}_A}{\sigma_A}$$

Where $x_{i,A}$ is each one of the values for the variable A, \bar{x}_A is the average of the values and σ_A is the standard deviation for the values of the variable A. Thereby the average value will be 0, and the standard deviation will be 1. That means given weight to σ .

24
2010 Pharmaceutical Freeze Drying Workshop Sheraton San Diego Hotel
PDA Workshop November 17-18

The Design Space (DS)

Connecting People, Science and Regulation

DATA TREATMENT (How manage the scale and the noise)

- **NOISE:** the instrumental and electrical noise, produced by the equipment limitations, should still be reduced:
- Four different techniques, in order to reach this reduction, were assayed: Moving Average, Median Filter, Savitsky-Golay and **Gaussian Filter:**

$$g(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{x^2}{2\sigma^2}}$$

Fitting by means of the Gaussian Filter returned the best results. The data window tested was one of either of 9, 15 or 21 data points, with 21 being selected.

The Design Space (DS)

Connecting People, Science and Regulation

DATA TREATMENT (Principal Component Analysis -PC-)

The fitting determines an analysis of 7 principal components (PC), each one grouping the 18 variables, giving different weight for each variable, in different fitting functions.

The first PC explains 53 % of the fitting; the second one explains 33 % and the third one explains 9 %. **With the three first PCs, we can explain 95 % of the fitting.**

Conclusions

Connecting People, Science and Regulation

First	<p>The first question</p> <ul style="list-style-type: none"> The process can be explained by means of the used statistical tool.
Second	<p>Next steps</p> <ul style="list-style-type: none"> A further step should be done using cycles whose corresponding parameters are between the third and fifth one tested. The second approach would be carried out with, at least, three cycles. Fewer variables should be selected, from the 18 variables, because just 12 really help us to define the DS. More variables can be added from the use of other PAT techniques, such as NIR.
Third	<p>The Target</p> <ul style="list-style-type: none"> Now we are going to build a new DoE, whose results will be tackled with the matrix corresponding to the CQA in order to obtain an operator that will establish the correlation between CPP and CQA to reach the golden batch (process signature) for the product.
